Overview

sourcedraft

Your own documents in. Editable slides and case studies out.
Every point shows the page it came from. Nothing is final until a named person approves it.

Grounded

The model writes only from your slides, PDFs and Word files. It has to name the source behind every bullet.

Checked

If it cites something that is not in your documents, or leaves a claim without a source, the run fails. Nothing is invented.

Approved by a person

The draft carries a DRAFT mark. The clean file only exists after someone approves it by name, and the record keeps who and when.

First use: a teaching deck (student slides, instructor notes in the speaker notes) and a student case with a separate teaching note, built from a publisher's slides, a chapter and your learning objectives. The same engine works for any course, client or topic.

Demo source text: Principles of Management, chapter 2, OpenStax, Rice University, CC BY 4.0.

What it does

Five steps, each one visible

1 Ingest

Reads your files and cuts them into small pieces. Each piece has an address like *chapter.pdf#p25*.

2 Retrieve

Finds the pieces that match the topic you chose.

3 Draft

The model writes only from those pieces and names the address behind every bullet.

4 Check

Any unknown address or uncited claim fails the run.

5 Approve

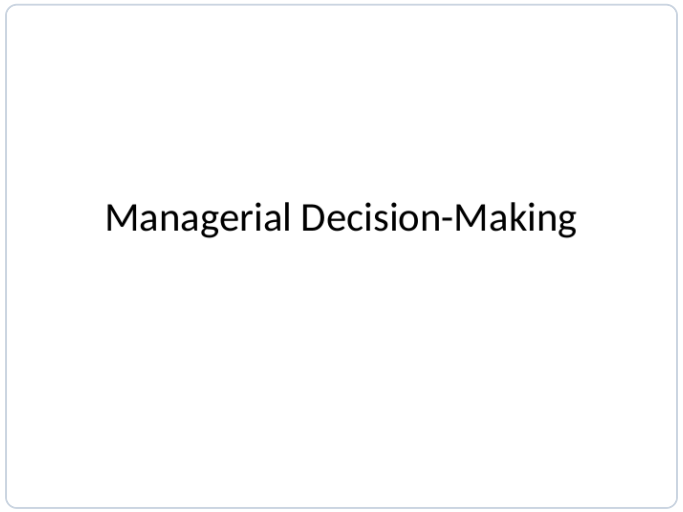

A person reviews and approves by name. Only then is the clean file produced.

Every run leaves a record

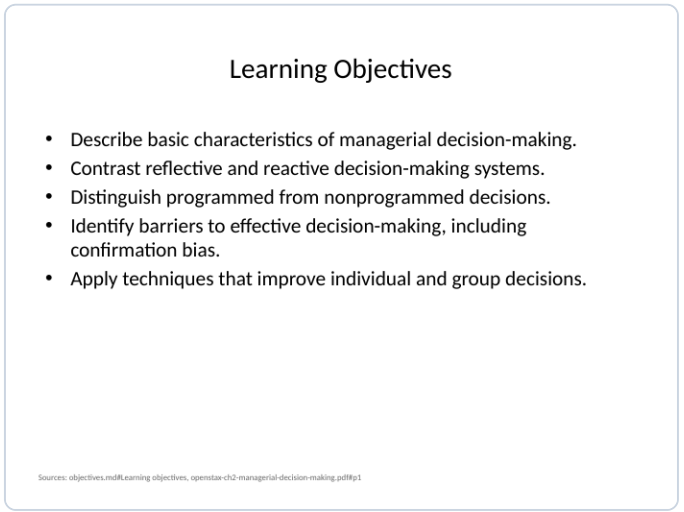

What was retrieved, exactly what the model returned, the check results, who approved and when, and a fingerprint of every input file. You can show a colleague, or an auditor, how any slide came to be.

The result

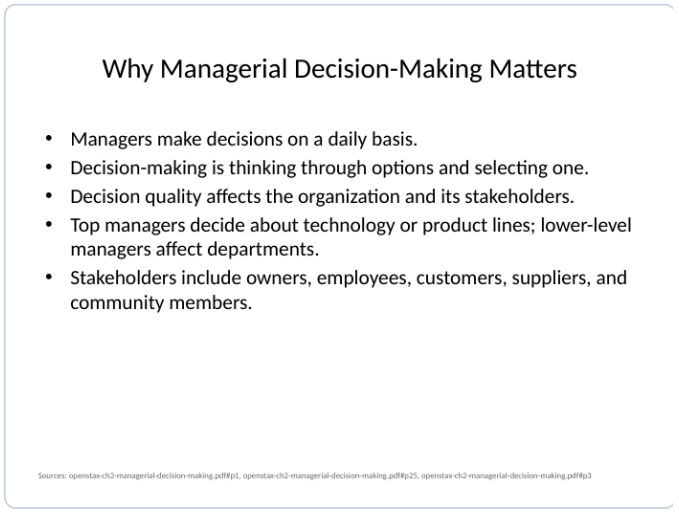

A teaching deck from one chapter and the course objectives

Title slide.

Student-facing slide. Short, no teaching asides.

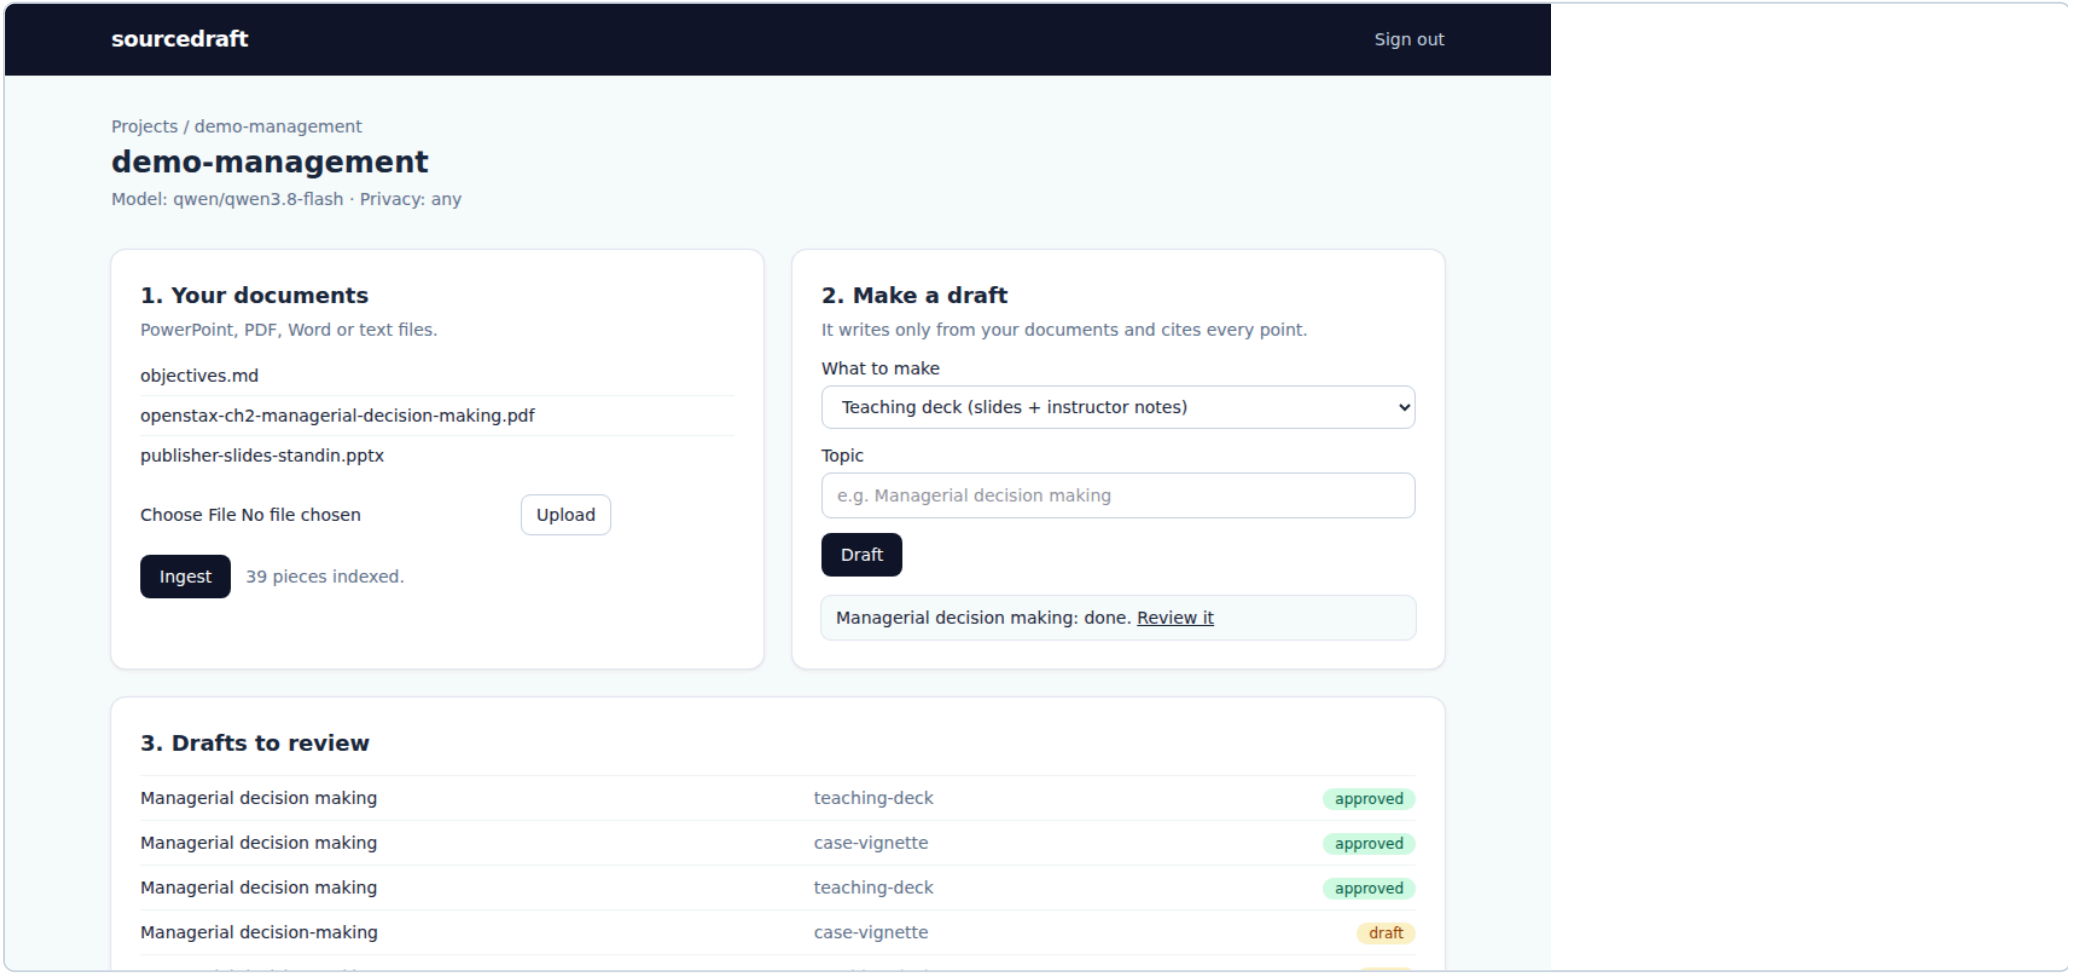

Every slide has a small source line at the bottom.

Instructor notes (what to say, what to ask) sit in the speaker notes, each with its source. The complete 16-slide deck is in the second PDF, *demo-deck.pdf*. A case vignette for students and a separate teaching note come from the same list of facts.

The web screen

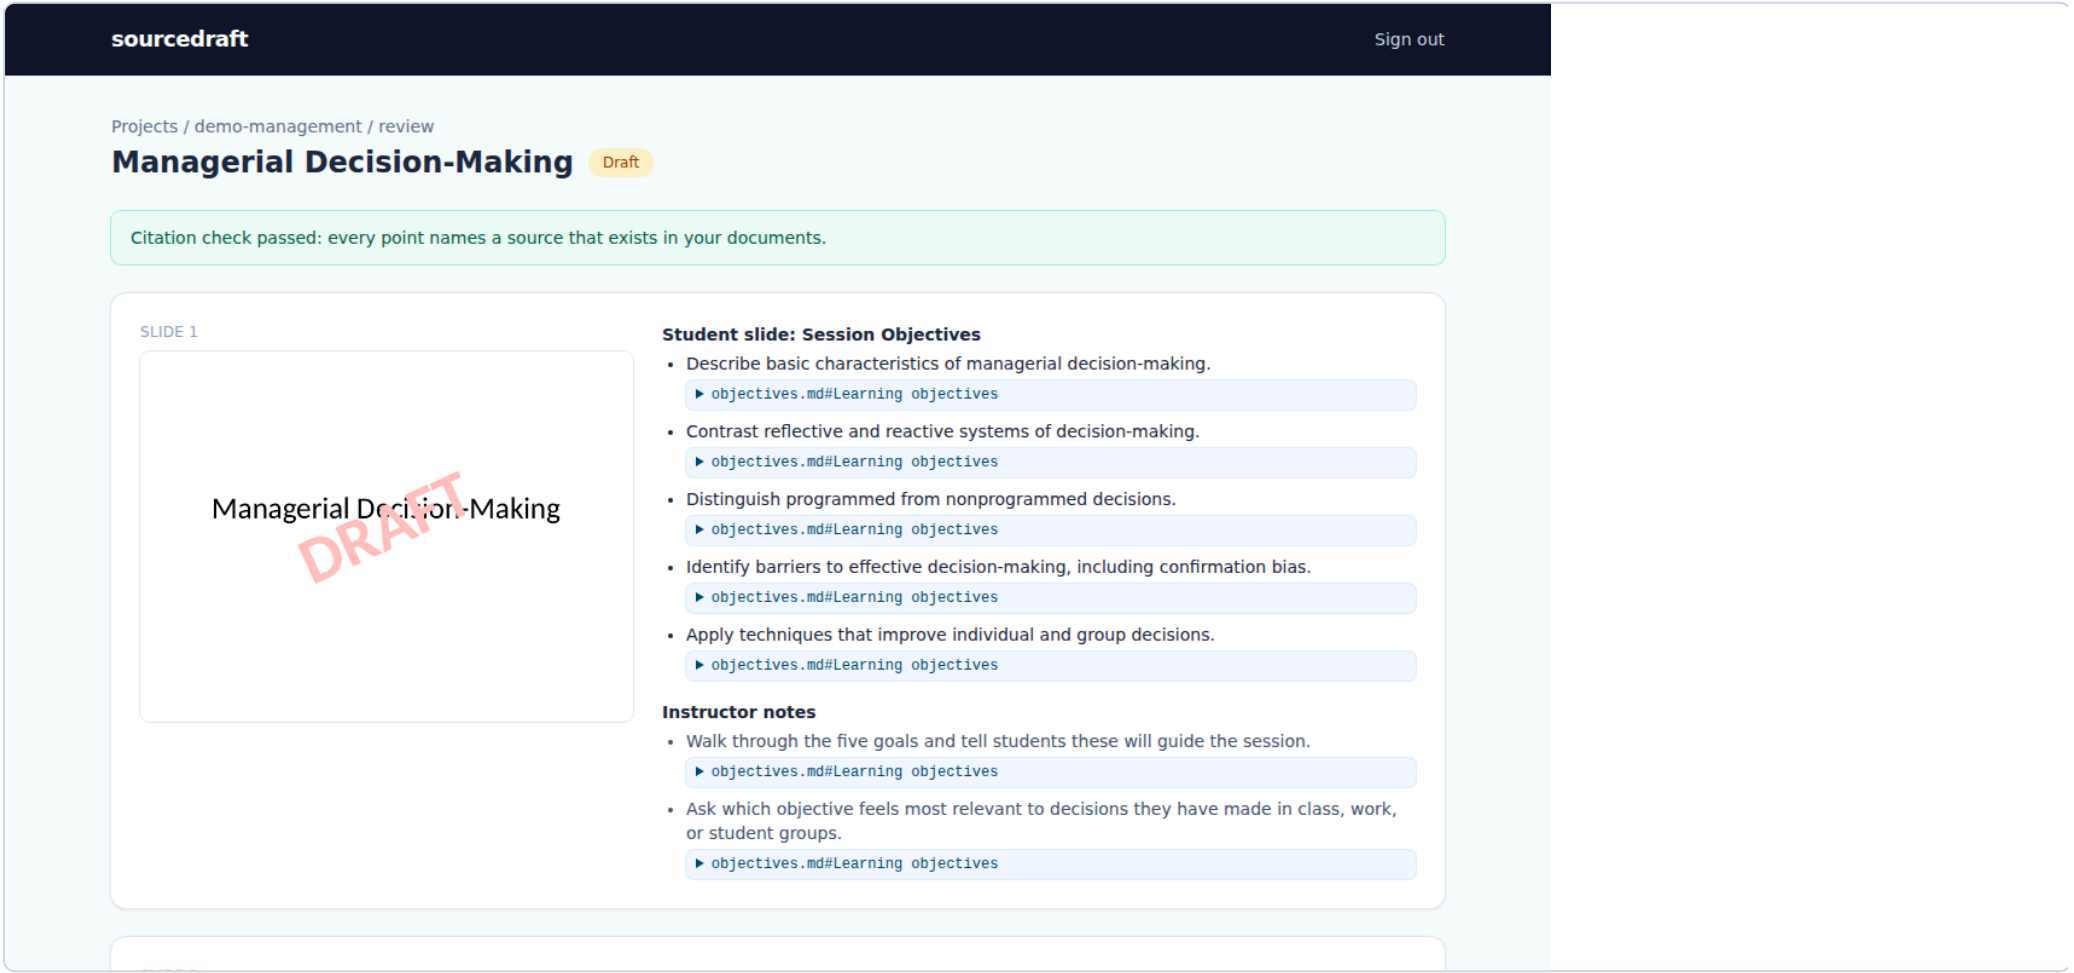

Add documents, choose what to make, start the draft

Project page. Left: your documents and the Ingest button. Right: what to make and the topic. Below: every draft and its status. Drafting runs in the background and the page updates by itself.

The web screen

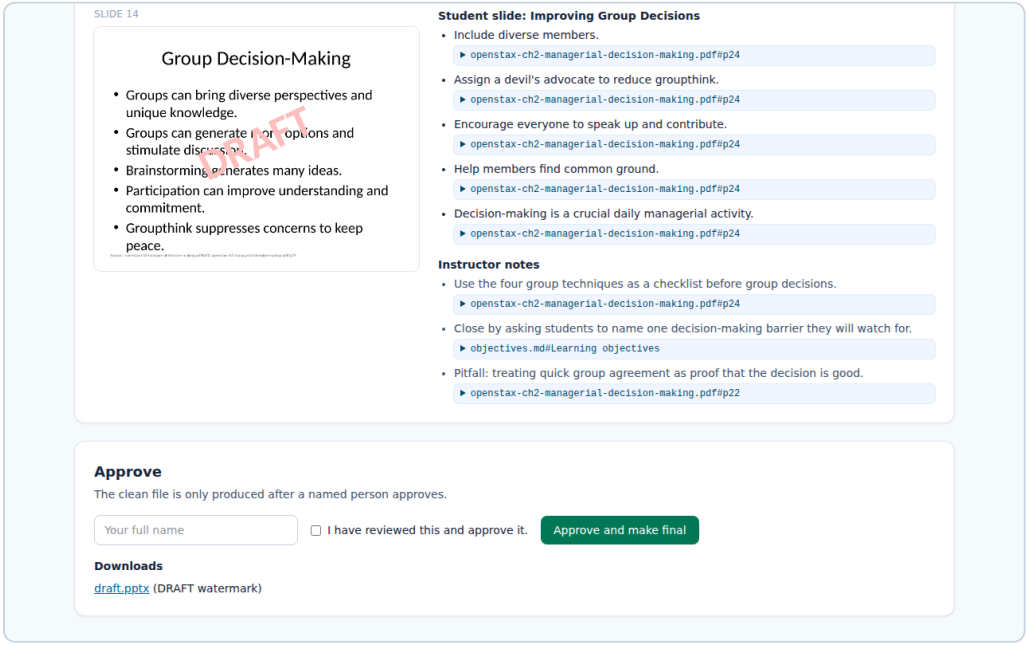

Review: the slide, the text, and where each point came from

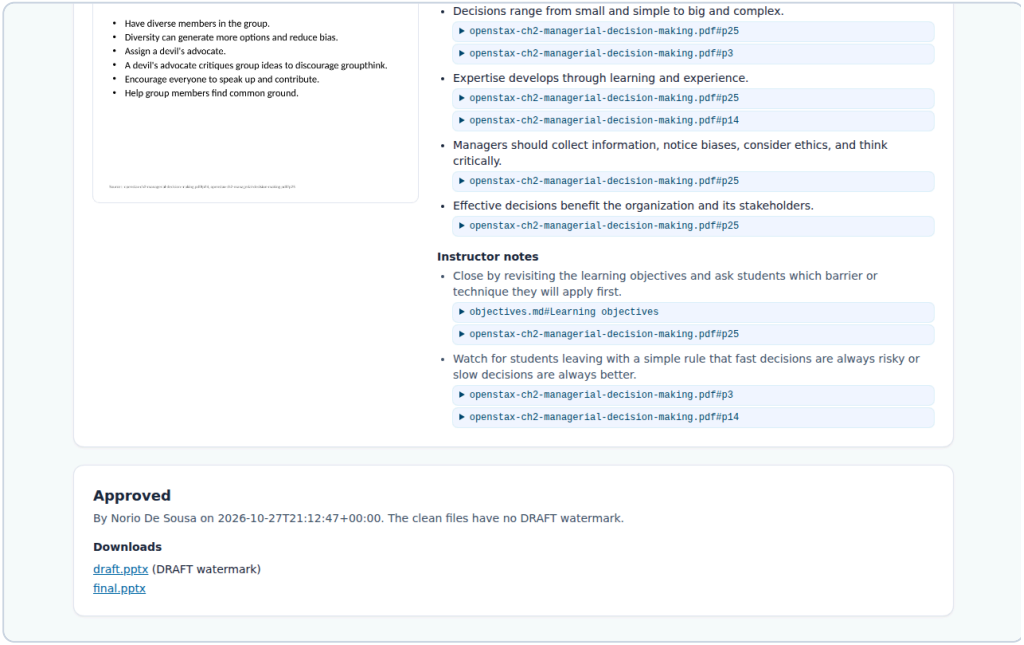

Review page. The slide image is on the left. On the right are the student text and the instructor notes. Click any source to read the exact passage it came from. The green bar says the citation check passed.

The web screen

Approve by name, then download the clean file

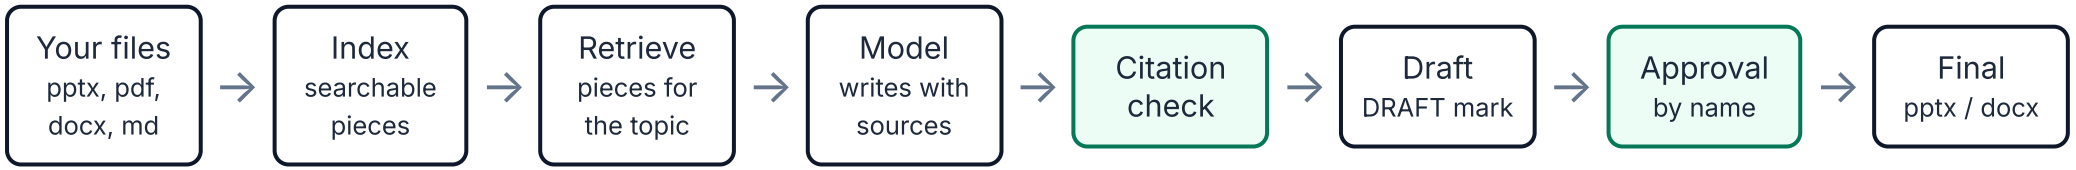

Before approval: a name and a tick box are required. The file still has the the DRAFT mark.

After approval: the clean slides, who approved and when, and the downloads.

How it works

The path from your files to the final file

If the check fails, the run stops and nothing is exported as a draft. A final file cannot be produced without an approval record.

Part	What it is
Engine	A small command-line program. Plain Python, no heavy frameworks.
Web screen	A separate web app that only calls the engine and reads its run folders.
Search	Keyword search built into the database file. One function to swap for smarter search later.
Output	Real PowerPoint and Word files that you edit as usual.

Privacy and swapping parts

You choose where your text goes

Option	Setting	Does text leave your machine?
Model on your own machine (Ollama, vLLM)	local address + *privacy: local-only*	No. Remote addresses are refused.
Your own cloud tenant (Azure OpenAI and similar)	your tenant's address	Only to your own tenant
OpenRouter (used in this demo)	openrouter.ai	Yes, to the chosen model provider

Each part is a folder or one setting

To change	Do this
New course, client or bid	Copy a project folder, drop files in, edit one settings file. No code.
Model or provider	One line in the project settings.
New kind of output	Copy a recipe folder: instructions, shape of the answer, search queries.
Your own look	Put your PowerPoint or Word template in the templates folder.

Next step

Phase 1: your content, in this tool

This demo used an open textbook chapter. Phase 1 is a paid scoping exercise on your own material:

- You send one sanitized chapter, plus the matching learning objectives and, if you have them, an existing deck for the look.
- I run it through sourcedraft and send you the draft deck, the case vignette and teaching note, and the run record.
- We review it together: what the output got right, what needs a different structure or template, and which privacy option fits.
- You leave with a clear, costed plan for the full build, based on your real content.

Nothing in the engine depends on this chapter, so your own documents and template slot straight in.
